What helps with Rheumatoid Arthritis?

First the Doctor prescribes a special medication. It can delay the destruction of the joints. Usually the medication that is prescribed is called methotrexate. It usually takes four to six weeks until it starts to work.

During this time the Doctor will give you other medications for the pain and inflammation. This can be cortisone. Or pain medication that treats both the inflammation and the pain. These medications are called ibuprofen or diclofenac.

Sometimes medications such as methotrexate do not work. Then the Doctor can prescribe another medication that delays the destruction of the joints.

At the same time it is very important to exercise the joints as much as possible, in spite of the pain. Helpful exercises are, for example, special gymnastic exercises.

To protect joints there are special aids. For example: forks and spoons with thicker handles are easier to use than ones with thinner handles.

That is why there are thick handle covers that are slipped onto standard forks and spoons.

The most important information about your illness, summarized for easy understanding.
Rheumatoid Arthritis – What is it?

With Rheumatoid Arthritis usually several joints are inflamed at the same time. They hurt and are swollen. Sometimes internal organs are also inflamed, for example the lungs or the heart.

Your Doctor told you that you have Rheumatoid Arthritis. Here is some information for you to better understand this illness.

Where does the pain come from?

The inside of the joints is covered with a membrane.
And if you have Rheumatoid Arthritis the membrane is inflamed.
What causes the inflammation is not yet known.
The inflamed joint membrane starts to grow quickly and becomes bigger and bigger.
It eats little holes into the cartilage and into the bones.
The cartilage is a layer that covers each joint to protect it.
In addition, lots of fluid forms inside of the joints.
This causes the joints to swell.
They hurt, are warm to the touch and do not work right anymore.

Smokers get sicker than non-smokers.
That is why it is important for people with Rheumatoid Arthritis to stop smoking.
Rheumatoid Arthritis usually starts with pain and swelling in the finger joints or in the toe joints.
Typically joints are stiff in the morning after you wake up.
They hurt very badly and are very hard to move.
This can last several hours.
Tiredness, weakness, fever or heavy sweating at night can also happen.
Because your whole body is fighting the inflammation.

During the course of weeks or months more and more joints can become inflamed.
The illness occurs in stages.
This means that the joints can really hurt from time to time and that you can feel really sick.
Then you are better for a while.

It is important to understand that the inflammation can damage the joints.
The damage can be so bad, that the joints can be completely destroyed.
That is why treatment should start as quickly as possible.
